- Summarizes the analysis (5 points)
  - This analysis looked into how different characteristics of schools impact student performance. It takes into account school size, type, spending, and how each school compares to each other based off of those details and their respective math and reading scores.
- Draws two correct conclusions or comparisons from the calculations (10 points)
  - We can surmise from the calculations that charter schools outperform district schools in both math and reading scores, as well as overall passing rates. This might be because of differences in teaching styles/curriculums, school environments, or familial/student support
  - We can also draw the conclusion that students at large schools have worse grades in comparison to their counterparts at small and medium-sized schools. This could be because of the student-teacher ratio at these schools which doesn't allow for individual attention.
